

GSA Air Dryers

ZEHB series

Blower zero purge desiccant air dryers

Global Standard Air & Gas

Why Desiccant Air Dryer?

Why Desiccant Air Dryer?

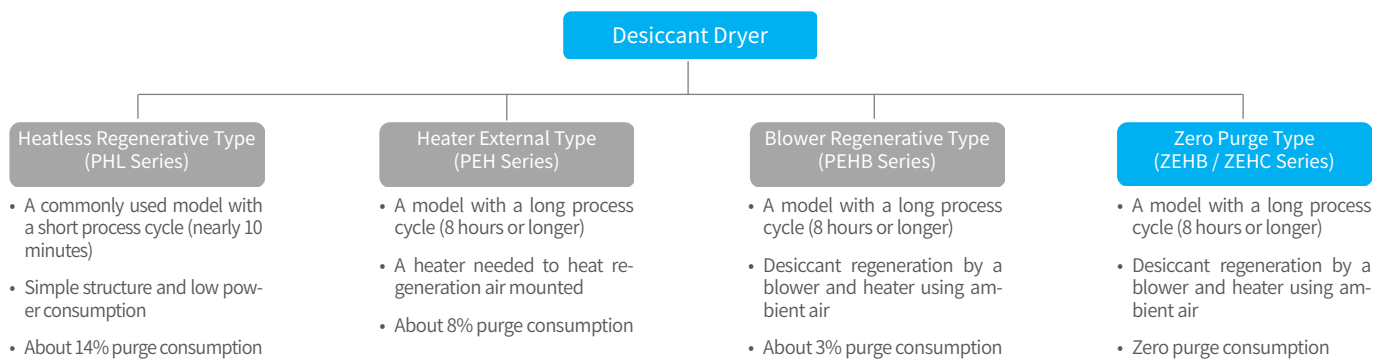

A refrigerated air dryer chills and dehumidifies compressed air, using a refrigerant. To prevent condensate generated while cooling compressed air from being frozen or a heat exchanger from being frozen-burst, dew points are usually kept at 0°C or higher. For moisture-sensitive processes, therefore, a desiccant air dryer is essential.

In general, a desiccant air dryer offers -40°C or lower temperature of dew points. It is used in various fields such as food & beverage, pharmaceuticals, petrochemicals, electronics & semiconductor and medicine. In these industries, even a small amount of water might result in process discontinuance or product defect. Therefore, a highly reliable desiccant air dryer is a must-have system.

GSA's desiccant air dryer is able to provide even super-dry compressed air (-100°C or below) according to user needs. We have enhanced customer satisfaction through the design of diverse desiccant air dryer systems.

Classification

Operating Mechanism

Compressed air with high moisture flows into the drying tower. While it moves from the bottom to the top of the tower, moisture is adsorbed by the charged desiccant, producing dry compressed air. While the air is being dried in the drying tower, other towers perform in regeneration process to remove adsorbed moisture. The regeneration process is divided into heating and cooling processes. During the heating process, the regeneration air sucked in from ambient air by a blower is heated up to the set temperature through an electrical heater. After moisture is removed, the heated regeneration air is discharged to the outside through a muffler at the bottom of the regeneration tower. Once the heating process is complete, the cooling process needed to cool down the heated desiccant in the regeneration tower begins. The cooling process is divided into ZEHB Type which cools down the desiccant, using the ambient air sucked by a blower and ZEHC Type that cools off the desiccant with coolant by circulating regeneration air.

Once the cooling process is done, the desiccant regeneration process is also finished. Then, re-press process pressurizing regeneration tower starts. Once the re-press process is done, two towers are switched. In the drying tower, then, the regeneration process is performed. In the towers where such regeneration process is completed, drying process is performed. A series of above processes are automatically repeated, providing dry compressed air.

In a zero-purge desiccant air dryer, the air compressor's load factor is low without any purge which is consumed during desiccant regeneration. Depending on the adsorption tower's regeneration temperature, diverse heating process control features are added, reducing power consumption (energy-saving model).

Desiccant Air Dryer for Stable Dew Points

Desiccant Air Dryer with Diverse Features

- 1 PAN/DUAL Check Valve**
High-performance pan/dual check valves with a little chance of breakdown used
- 2 Minimization of Purge Air Loss**
Minimizes compressed air loss through accurately calculated orifice sizing and precision processing
- 3 SAFETY VALVE**
Ensures safety with KOSHA-certified safety valves
- 4 CONTROL AIR FILTER**
A control-purpose compressed air filter installed to prevent valves and pneumatic solenoid valves from malfunctioning
- 5 High-quality Desiccant**
Stable dew points with high-quality activated alumina
- 6 High-quality Pressure & Temperature Gauges**
High performances and low faults with highly reliable pressure and temperature gauges
- 7 PLC and Touchpanel**
A touchpanel designed for PLC and user convenience applied; able to operate and get diverse information easily
- 8 High-quality Ring Blower**
Low noise and low faults despite long operation with a high-quality ring blower
- 9 Electric Heater**
An immersion heater with very low heat loss and great heating performances used
- 10 Pneumatic Solenoid Valve**
Reliable operation is ensured by using high-quality pneumatic solenoid valves
- 11 Power Regulator (Specifications Applied)**
Able to control a heater efficiently through this power regulator and reduce power consumption
- 12 High-quality Muffler**
Minimizes noise from the purge with an high-quality or specially designed (large model) muffler
- 13 Highly Reliable Auto Valve**
Proven angle sheet and butterfly valves used
- 14 Efficient Compressed Air Distribution System**
A bottom distributor installed to prevent the bias flow of compressed air in a large adsorption tower and provide stable dew points

Technical Specification

Design Conditions

- Inlet Pressure : 7 barg
- Inlet Temperature : 38 °C
- Dew Points : -40 °C @ ATM
- Design Temperature : 250 °C
- Design Pressure : 9.7 barg
- Differential Pressure : 0.2 bar
- Inlet air conditions : ISO 8573.1:2010 Class 4.4.1

References

- Those with -40°C or below dew points are also customizable.
- ASME specifications in addition to KS are also customizable.
- A unit with 9.8 barg or higher operating pressure is custom-made.
- Special-purpose models in addition to the proposed specifications are also customizable.
- Large models bigger than those stated in the specifications above are also customizable.
- The specifications are subject to changes without notice for product improvement.
